Network Firmware  
Update for Remote  
Devices

## CONFIG terminal configuration module

The **CONFIG** terminal configuration module works with the CONFIRM family of software products to allow remote status monitoring, configuration, and upgrading of your mobile terminal installations via your existing wide area network.

Imagine being able to verify the operational status of every mobile terminal on your network within seconds, without leaving your office. Trouble shoot terminal configuration issues in minutes. Make the corrections via the network and your back up and running in no time.

The **CONFIG** system allows you to roll out software modifications or feature upgrades to the terminal firmware via the network. You no longer have to touch every box to deploy an upgrade to the entire fleet.

The **CONFIG** system is the easiest and most flexible software available to give you complete control over the equipment on your network.

For many IT managers, the **CONFIG** program has been the most popular module in the suite. The only hard part, is explaining why you had so much budget left over after all the "air fare" savings.
